

## I. Climate Classification

- A. \_\_\_\_\_ & \_\_\_\_\_ are generally chosen as the most significant & understandable features of climate when narrowing down climatic characteristics to classify.
1. Climate is a complex phenomenon to understand given its ability to \_\_\_\_\_ over time.
- B. The Köppen Climate Classification System is the most widely used system in the world today.
1. It's database uses only the mean \_\_\_\_\_ & \_\_\_\_\_ values of temperature & precipitation.
    - a. Four of five zones are defined by temperature; the fifth by moisture.
      - (1) Each of the five zones is subdivided according to various temperature & precipitation types.
      - (2) A sixth zone has been added for high-elevation climates.
- C. The Köppen Letter Code System uses a descriptive name followed by a series of classifying letters
1. The letters are defined by specific temperature and/or precipitation values.
    - a. The first letter designates the major \_\_\_\_\_ group.
    - b. The second letter usually describes \_\_\_\_\_ patterns.
    - c. The third letter (if any) describes \_\_\_\_\_ patterns.
- D. \_\_\_\_\_ are simple graphic representations of \_\_\_\_\_ temperature & precipitation data gathered from a specific weather station.
1. They are the most useful tool for studying world climate classification.
    - a. They display precise details of important aspects of the climate of a specific place.
    - b. They can be used to \_\_\_\_\_ of that place.

## II. World Distribution of Climate Types

- A. Tropical Humid Climates (Group A) are the only truly \_\_\_\_\_ climates of the world.
1. Latitudinal location molds the basic character of zone A climates.
    - a. They dominate the \_\_\_\_\_ regions extending to about the 20° N & S of the equator.
  2. Prevalence of moisture: most locations in zone A are among the wettest places in the world
    - a. Abundant sources of moisture (\_\_\_\_\_. or more/year) & mechanisms for uplift (convection).
  3. There are three types of zone A climates (Af, Aw, Am):
    - a. Tropical wet (Af) is a \_\_\_\_\_ climate with the same weather day after day.
      - (1) Latitude is the primary determinant caused by uniform (the same) solar radiation (insolation) all year.
      - (2) There is little to no temperature variation (averages about \_\_\_\_\_ all year).
    - b. Tropical savanna (Aw) (averages about 80° F all year) is the most extensive of the A climates.
      - (1) There is a clear-cut seasonal alternation of \_\_\_\_\_ periods.
      - (2) Annual rainfall is generally less than the other two A climates
        - (a) \_\_\_\_\_ are common during the dry season.
      - (3) The migration of the ITCZ coincides with upper limits of the tropical savanna climate.
    - c. Tropical monsoonal (Am) climate is similar to tropical wet, except for heavy rainfall (averages about \_\_\_\_\_/year) & lower temperatures that occur with the summer monsoon season (heavy cloud cover reflects some of the insolation)
    - d. Collectively, tropical savanna & tropical monsoon are sometimes referred to as \_\_\_\_\_ & \_\_\_\_\_ climates.
- B. Dry Climates (Group B) cover \_\_\_\_\_ than any other climatic zone; about 30% of the Earth's land surface.
1. They are caused more by a \_\_\_\_\_ rather than lack of moisture in the air.

2. Dry climates are divided into four types (BWh, BWk, BSh, BSk), with a distinction made between steppe & desert, and where they occur.

a. The subtropical desert climate (BWh) (arid) lies either in or very near \_\_\_\_\_ of the equator (w/in the band of subtropical highs).

(1) The Sahara & the Arabian deserts are examples.

(2) Many of the deserts are found along the \_\_\_\_\_ of continents due to \_\_\_\_\_ off their coasts (the Atacama in S.A., the Namib in Africa)

(3) Precipitation is \_\_\_\_\_, unreliable, but intense, local, & brief when it does occur.

(4) They can possess astounding daily temperature variations, commonly with as much as a \_\_\_\_\_ difference between \_\_\_\_\_ in the spring & fall.

b. The mid-latitude desert climate (BWk) (arid) occurs deep in the \_\_\_\_\_ of continents.

(1) Precipitation is similar to subtropical deserts, except their is seasonality

(2) Temperature is very different from subtropical deserts in that they have \_\_\_\_\_ winters.

c. The subtropical steppe climate (BSh) (semi-arid) typically \_\_\_\_\_ subtropical deserts & has similar temperature & precipitation patterns, just not as extreme.

(1) Rainfall is somewhat greater & more reliable.

(2) Temperatures are more \_\_\_\_\_, not as extreme.

d. The mid-latitude steppe climate (BSk) (semi-arid) occupies a \_\_\_\_\_ zone between mid-latitude deserts & humid climates.

(1) There is more precipitation & less temperature extremes than neighboring deserts.

C. Mild Mid-Latitude Climates comprise Group C & occupy a region generally from the equatorward margin of the middle latitudes & extending into the subtropics; also extending poleward along western coastal areas.

1. They are known for having long & usually \_\_\_\_\_ & short, relatively mild winters.

2. They do not have a year-round growing season.

3. Precipitation is highly \_\_\_\_\_ across the subdivisions.

4. Subdivisions of the C climates are determined primarily on \_\_\_\_\_ seasonality & secondarily on summer temperatures.

a. The Mediterranean climate zones (Csa, Csb) are found mainly on the \_\_\_\_\_ sides of continents.

(1) Influenced why \_\_\_\_\_ winds; almost all precipitation comes from west moving \_\_\_\_\_ storms.

(2) Coastal areas have much milder summers than inland areas due to the \_\_\_\_\_.

b. The humid subtropical climates (Cfa, Cwa, Cwb) are generally found on the \_\_\_\_\_ of continents (this is Georgia's climate zone).

(1) They extend across more latitudes than the Mediterranean climates.

(2) Summer temperatures are warm to hot & summers possess \_\_\_\_\_ levels of \_\_\_\_\_.

(3) Winter temperatures are \_\_\_\_\_, but can have episodes of severely cold weather brought by west moving \_\_\_\_\_.

c. Marine west coast climates (Cfb, Cfc) occur about 40° to 60° in latitude and on the \_\_\_\_\_ (windward) side of continents.

(1) It extends to the east coast in some Southern Hemisphere areas (example: South America).

(2) Temperatures are \_\_\_\_\_ with few extremes due to the moderating of the \_\_\_\_\_.

(3) It is among the \_\_\_\_\_ of the mid-latitude climates.

(4) Lowland areas rarely get snow, by higher altitudes can receive some of the \_\_\_\_\_ in the world along their \_\_\_\_\_-facing slopes.

(5) Rainfall probability and reliability is \_\_\_\_\_; the intensity low.

D. The severe mid-latitude climates only occur in the \_\_\_\_\_ Hemisphere between about 40° & 70° N. There is little landmass at these latitudes in the Southern Hemisphere.

1. \_\_\_\_\_ generates extremes between summer & winter temperatures due to the \_\_\_\_\_ of the moderating effects of water.

2. There are \_\_\_\_\_ distinct seasons.

3. Moderate precipitation with good soil moisture.

4. Divided into two subtypes: humid continental & subarctic.

a. Humid continental climates (Dfa, Dfb, Dwa, Dwb) are generally found between 35° & 60°.

(1) There are four subtypes based on latitude.

(2) Variability in weather is the main characteristic both \_\_\_\_\_.

(i) Cold fronts, warm fronts, heat waves, blizzards, thunderstorms, tornados, etc...

(3) \_\_\_\_\_ prevailing winds cause frequent weather changes especially in the winter.

(4) Summers are as warm as humid subtropical, but \_\_\_\_\_.

b. The subarctic climates (Dfc, Dfd, Dwc, Dwd) occupy \_\_\_\_\_ mid-latitudes generally between 50° & 70°.

(1) They create two vast \_\_\_\_\_ expanses: Alaska to Greenland & from Scandinavia to the easternmost part of Siberia in Russia.

(2) “\_\_\_\_\_” means northern and is used in Canada (think: aurora borealis).

(3) “\_\_\_\_\_” is the term used in Eurasia, named after the forests.

(4) \_\_\_\_\_, dark, bitterly cold winters, the dominant season.

(5) Mild summers very \_\_\_\_\_.

(6) \_\_\_\_\_ annual temperature ranges in the world

(7) Very little precipitation.

E. Polar climates comprise Group E. No month has an average temperature above 50° F.

1. \_\_\_\_\_ annual temperatures in the world.

2. Extraordinarily \_\_\_\_\_ (polar deserts), but humid due to low evaporation.

3. Two subtypes (ET, EF) tundra and polar ice cap.

a. The tundra climate (ET) has grasses but \_\_\_\_\_ due to the ground being permanently frozen starting just a few inches from the surface (\_\_\_\_\_).

(1) Freezing temps can occur at any time.

(a) Only \_\_\_\_\_ months have average temps above freezing.

b. The ice cap climate (EF) occurs in \_\_\_\_\_ and most of \_\_\_\_\_.

(1) All monthly temperature averages are \_\_\_\_\_.

(2) Permanently covered with ice and snow.

(3) Strong winds are prevalent.

F. The highland climate (Group H) is determined by \_\_\_\_\_ not latitude.

1. Very complex local climate variations in small areas at different altitudes.

2. Climate controls are \_\_\_\_\_ & angle of \_\_\_\_\_ to the Sun and winds.
- Latitude is less important, altitude is more.
  - Leads to patterns of \_\_\_\_\_ especially in tropical highlands.
  - Highlands have a \_\_\_\_\_ and \_\_\_\_\_ side of exposure.
    - Heavier precipitation and winds on the \_\_\_\_\_ side. Rapid cloud development due to \_\_\_\_\_.
    - Dry on the \_\_\_\_\_ side (\_\_\_\_\_ deserts)
  - Daily temperature changes can be very high.

### Climograph Practice

Average Temperature, Burlington VT

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Year
